

## CLAIM AMENDMENTS

Claim 1-13 (canceled).

Claim 14 (currently amended): A heat dissipating arrangement for a portable computer, comprising at least two heat dissipating members adapted for installing into said portable computer for dissipating heat therefrom, wherein each of said heat dissipating members comprises:

a plate body defining a heat dissipating surface and a peripheral edge;

at least a heat guiding channel having a circular shape integrally protruded from said heat dissipating surface of said plate body and defining a circular edge;

at least a folding arm integrally and bendably extended from said peripheral edge of said plate body, wherein said folding arm is bent to transversely extended from said head dissipating surface and to overlap with said folding arm of another said adjacent plate body so as to enhance a contacting area between said heat dissipating members; and

at least an engaging arm integrally and bendably extended from said peripheral edge of said plate body at a position adjacent to said folding arm, wherein each of said engaging arms, having a Y-shape, is integrally extended from said peripheral edge of said plate body in a bendable manner, wherein said engaging arm has a narrowed root portion bendably and outwardly extended from said peripheral edge of said plate body and an engaging head portion extending from said root portion, wherein said engaging head portion of each of said engaging arms forms two engaging wings adapted to engage with said root portion of another said engaging arm, wherein said root portion of said engaging arm of each of said heat dissipating members is bent to transversely extended from said heat dissipating surface that said engaging head portion of said engaging arm of said heat dissipating member is substantially engaged with said root portion of said engaging arm of another said heat dissipating member to spacedly lock up said heat dissipating member at a position that said circular edge of said heat guiding channel of said heat dissipating member is contacted with said heat dissipating surface of said adjacent heat dissipating member such that said heat guiding channels are coaxially aligned with each other to form an elongated heat conducting conduit, wherein

said heat dissipating members are communicatively mounted side by side while said heat dissipating surfaces of said heat dissipating members are spaced apart between said heat guiding channel for dissipating said heat from said portable computer;

thereby, the user is able to selectively assemble a predetermined number of heat dissipating members by bending said folding arm to overlap with said adjacent folding arm and bending said root portion of said engaging arm to engage said head portion of said engaging arm with said root portion of said adjacent engaging arm.

**Claim 15 (previously presented):** The heat dissipating arrangement, as recited in claim 14, wherein said two engaging wings are symmetrically identical, wherein said root portion of each of said engaging arms is bent 90 degrees with respect to said plate body to engage said engaging wings of said engaging arm with said root portion of another corresponding said engaging arm at said peripheral edge of said plate body.

**Claim 16 (previously presented):** The heat dissipating arrangement, as recited in claim 14, wherein each of said folding arms is downwardly bent 90 degrees to transversely extend from said heat dissipating surface of said plate body to overlap with said folding arm of another said heat dissipating member.

**Claim 17 (previously presented):** The heat dissipating arrangement, as recited in claim 15, wherein each of said folding arms is downwardly bent 90 degrees to transversely extend from said heat dissipating surface of said plate body to overlap with said folding arm of another said heat dissipating member.
